

Chapter 10: Origin of Mass

The Origin of Mass

After the Big Bang
all the known particles were massless.

They are not massless now.

Their masses violate $SU(2)_L$ charge conservation!

HIGGS BOSON

H

The **HIGGS BOSON** is the theoretical particle of the Higgs mechanism, which physicists believe will reveal how all matter in the universe get its mass. Many scientists hope that the Large Hadron Collider in Geneva, Switzerland will detect the elusive Higgs Boson when it begins colliding particles at 99.99% the speed of light.

Wool felt with gravel fill for maximum mass.

provides the extra polarization

Broken Symmetry

Higgs Mechanism

Gauge Boson Masses

$$\langle H \rangle = \frac{v}{\sqrt{2}} \quad + \quad \text{---} \quad + \quad W^\pm$$

The diagram illustrates the production and decay of a Higgs boson. On the left, a blue dashed line with a red cross at its end represents the Higgs boson, labeled with the equation $\langle H \rangle = \frac{v}{\sqrt{2}}$. This line splits into two red wavy lines, each with a red cross at its end, representing two photons. These photons then interact with a red wavy line with a red cross at its end, representing a W^\pm boson. The W^\pm boson then decays into two more red wavy lines with red crosses at their ends, representing two photons. The overall process is labeled with W^\pm on the right side.

$$M_W^2 = \frac{g^2 v^2}{4}$$

$$M_W = 80.4 \text{ GeV}$$

$$M_W, M_Z$$

Massless Fermion

can't move faster than the fermion:
handedness is invariant

Massless Fermion

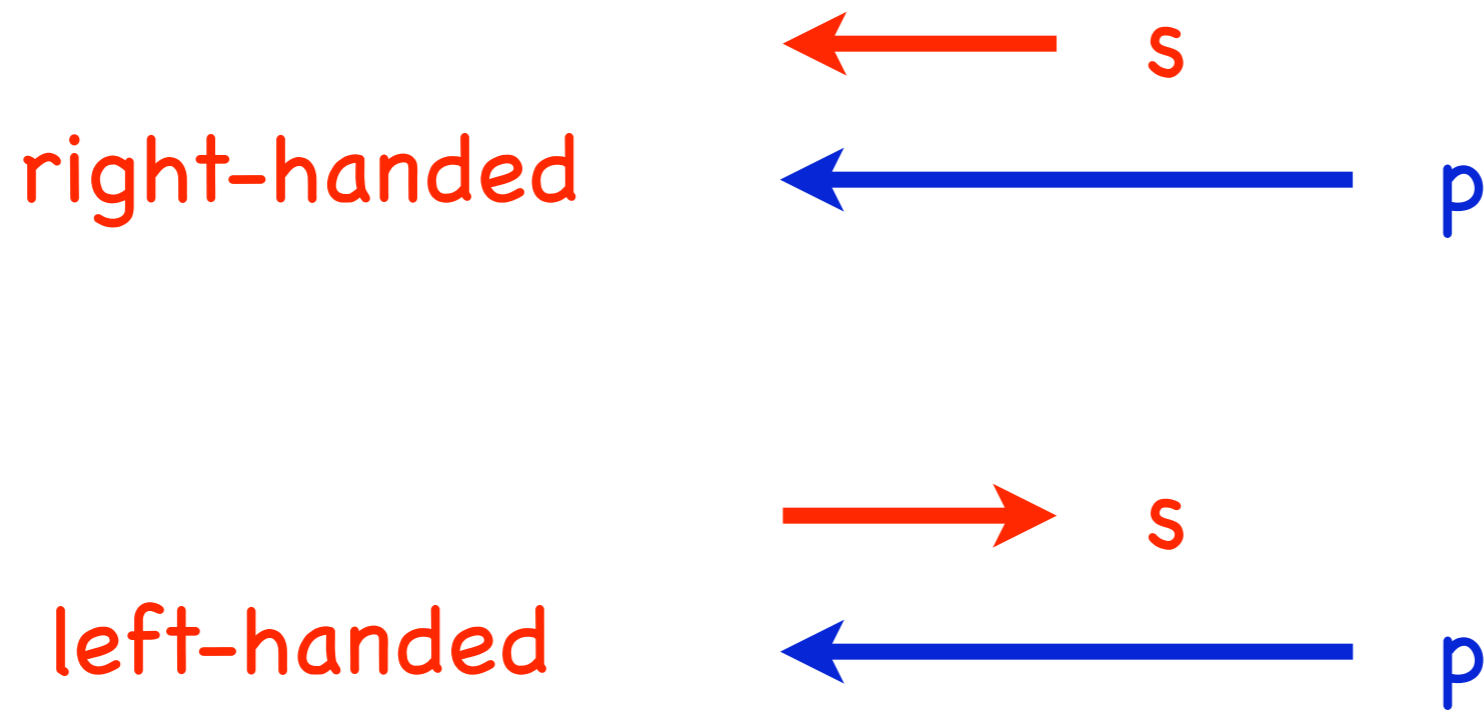

can't move faster than the fermion:
handedness is invariant

for massless fermions helicity = chirality
chirality is always Lorentz invariant

Massive Fermion

moving faster than the fermion flips p
also flips handedness

Massive Fermion

moving faster than the fermion flips p
also flips handedness

but just propagating flips handedness
weak charge is not conserved

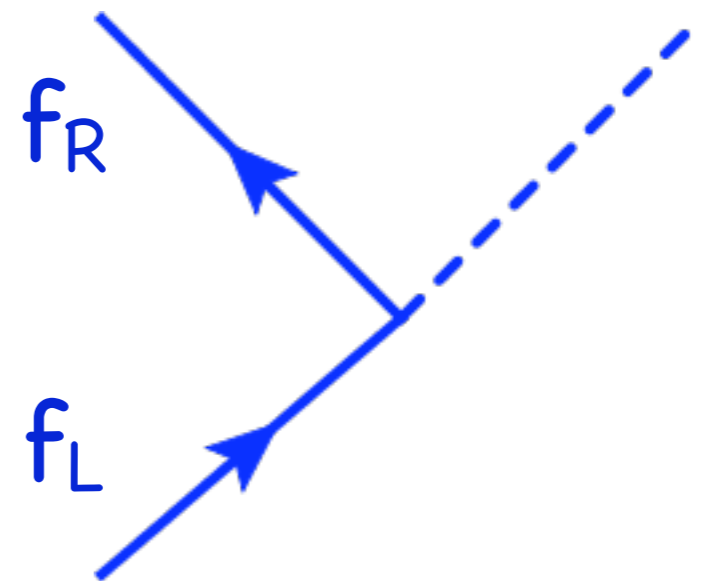

Higgs Boson

$SU(2)_L \times U(1)_Y$ gauge bosons

couples left-handed and
right-handed fermions

Higgs Field and Mass

$$2s + 1 \text{ states}$$

$$s = \frac{1}{2}$$

mass connects left-handed and
right-handed electrons

$$s = 1$$

massless gauge bosons have 2 polarizations
but
massive gauge bosons have 3 polarizations

Fermions and Bosons

FERMIONS

matter constituents
spin = 1/2, 3/2, 5/2, ...

Leptons spin = 1/2

Flavor	Mass GeV/c ²	Electric charge
ν_e electron neutrino	$<1 \times 10^{-8}$	0
e electron	0.000511	-1
ν_μ muon neutrino	<0.0002	0
μ muon	0.106	-1
ν_τ tau neutrino	<0.02	0
τ tau	1.7771	-1

Quarks spin = 1/2

Flavor	Approx. Mass GeV/c ²	Electric charge
u up	0.003	2/3
d down	0.006	-1/3
c charm	1.3	2/3
s strange	0.1	-1/3
t top	175	2/3
b bottom	4.3	-1/3

BOSONS

force carriers
spin = 0, 1, 2, ...

Unified Electroweak spin = 1

Name	Mass GeV/c ²	Electric charge
γ photon	0	0
W^-	80.4	-1
W^+	80.4	+1
Z^0	91.187	0

Strong (color) spin = 1

Name	Mass GeV/c ²	Electric charge
g gluon	0	0

Mass comes from Higgs field
that pervades all space.
